The measures CNT_2 and NCNT_2 are defined in the paper as the L_1 distance between a point representing a system of dichotomous random variables and the surface of the noncontextuality polytope. The values of the dichotomous variables can be chosen arbitrarily: Switching from the $\{0, 1\}$ values to $\{a, b\}$ amounts to multiplying all values of CNT_2 and NCNT_2 by $(a - b)^2$. In our paper, CNT_2 and NCNT_2 were defined for $\{0, 1\}$ variables, but when it was more convenient, we also used the $\{-1, +1\}$ labeling so that the L_1 distance in question was 4 times the value of CNT_2 or NCNT_2 . By an oversight, in Secs. VIII and IX, where the $\{-1, +1\}$ labeling was used, the coefficient 4 was omitted. So every occurrence of CNT_2 and NCNT_2 in these sections should be multiplied by 4 to be consistent with their definition in earlier sections. This applies only to the text of these sections; the numerical values in Figs. 14 and 15 are shown for the $\{0, 1\}$ labeling as they should.
