**Erratum: Doppler-limited precision spectroscopy of HD at 1.4 μm :
An improved determination of the $R(1)$ center frequency
[Phys. Rev. A **103**, 022828 (2021)]**

There is a mistake in the updated determination of the center frequency of the $R(1)$ line of the HD 2-0 band. In fact, the blueshift due to the recoil effect is present in linear absorption spectroscopy and it is not negligible in a light molecule such as hydrogen deuteride. This shift amounts to 34.6 kHz. Therefore, the corrected position of the $R(1)$ line is 217 105 181.901 MHz with a global uncertainty of 76 kHz. The uncertainty budget, all discussions, and concluding remarks remain unaltered.
