We realize recently that the signs of the electric quadrupole moment (Θ) values presented in our paper have negative signs, but the correct values have positive signs with respect to the values reported for other atoms in the literature. This error is due to the convention of the electric quadrupole operator used by us which has a different sign than the others. We also noted that the unit of the Θ values is given as $10^{-11} \text{ Hz V}^{-1} \text{ m}^2$ in Table V of our above paper, which is supposed to be $10^{-11} \text{ kHz V}^{-1} \text{ m}^2$. This error was introduced while converting values from atomic units to SI units.

We would like to thank Dr. S. King, QUEST Institute for Experimental Quantum Metrology, Physikalisch-Technische Bundesanstalt, Germany for bringing the above unit conversion error to our attention.

Correction: An error in the corrected unit for the Θ values was introduced during the production process and has been fixed.
