**Erratum: Massive gauge boson pair production at the LHC:
A next-to-leading order story

The combination of the theoretical uncertainties of W^+Z and W^-Z channels into a single WZ channel was done incorrectly [pages 21-22, point (iii)]. Instead of summing the absolute errors in pb we summed the percentage errors, leading to an overestimation of the theoretical uncertainties on the combined WZ channel.

The correct expressions should read $\sigma_{WZ}^{\text{th}} = 18.3^{+1.2}_{-1.0}$ pb at 7 TeV and $\sigma_{WZ}^{\text{th}} = 22.7^{+1.4}_{-1.1}$ pb at 8 TeV. The agreement with ATLAS and CMS results quoted in the point (iii) should read as follows: at 7 TeV a 0.3σ agreement with ATLAS and a 0.4σ agreement with CMS, at 8 TeV a 1.2σ agreement with ATLAS. Figure 23 should be corrected as well, and the following Fig. 1 replaces the corresponding WZ plot in Fig. 23 of the paper.

FIG. 1. The NLO QCD + EW total cross section (black/full, in pb) of the process $pp \rightarrow W^+Z + W^-Z$ at the LHC as a function of the center-of-mass energy $\sqrt{s}$ (in TeV) including the total theoretical uncertainty (red/dashed) as discussed in the text. The inset shows the relative deviation from the central cross section, and the experimental data points are also displayed on the main figure.
